## EXECUTIVE SUMMARY

In 2012, the Florida Department of Transportation (FDOT) Central Aviation Office selected a team lead by *Kimley-Horn and Associates*, *Inc.* and including their subconsultants Peneul Consulting, LLC, Roy D. McQueen & Associates, LTD, and All About Pavements, Inc., to provide services in support of FDOT in the continued efforts of updating the existing Statewide Airfield Pavement Management Program (SAPMP). This work is to be completed over the fiscal years of 2013 and 2014.

The tasks required to achieve this objective at each participating airport specifically included the following:

- Obtain recent construction history from the airport to update the Pavement Network Definition Exhibits using CADD from the previous SAPMP update.
- Update the airport pavement inventory data (construction history, geometry, identification, and classification) based on airport information provided.
- Update the FDOT SAPMP MicroPAVER database files and system tables for the purpose of analyzing field data for Pavement Condition Index (PCI) calculation of current pavement condition
- Development of pavement performance models for the approximation of future pavement performance.
- Development of a maintenance and repair plan, and a 10-year major rehabilitation program to address the pavement needs based on condition.
- Development of planning level opinions of probable costs for pavement preservation and rehabilitation.

During AUGUST 2013, a PCI survey inspection was performed at Bartow Municipal Airport. The results of the inspection indicate that, based on ASTM 5340-11, the airport's airfield pavement facilities had an overall area-weighted average PCI 61, representing a FAIR overall network condition. Table I summarizes the overall condition summary by network level branch in comparison to the FDOT recommended minimum service level.

Branch Name	Area Weighted PCI	PCI Range	Average Condition Rating	FDOT Minimum Service Level	MicroPAVER Minimum PCI	Action Required
APRON FBO	91	91	GOOD	60	65	
HOLD APRON TW A	28	28	VERY POOR	60	65	Х
NORTH APRON	40	19 - 100	VERY POOR	60	65	Х
T-HANGAR APRON	59	51 - 100	FAIR	60	65	Х
RUNWAY 5-23	58	51 - 87	FAIR	75	65	Х
RUNWAY 9L-27R	85	76 - 95	SATISFACTORY	75	65	
RUNWAY 9R-27L	33	24 - 79	VERY POOR	75	65	Х
TAXIWAY A1	100	100	GOOD	65	65	
Taxiway A2	87	78 - 100	GOOD	65	65

TAXIWAY F	76	49 - 100	SATISFACTORY	65	65	Х
TAXIWAY G	36	28 - 45	VERY POOR	65	65	Х
ΤΑΧΙΨΑΥ Η	100	100	GOOD	65	65	

#### Table I: Condition Summary by Branch

For project level planning and inspection development; the airfield pavement facilities have been divided at the branch level based on facility use and designation, and at the section level based on pavement construction history, composition (e.g. asphalt versus concrete), aircraft traffic operations, and pavement surface conditions. Table II provides the overall area weighted condition of the pavement based on facility branch use.

#### Table II: Condition Summary by Pavement Facility Use

Use	Average Area- Weighted PCI	Condition Rating
Runway	61	FAIR
Taxiway	75	SATISFACTORY
Apron	49	POOR

Based on the inspection performed at the airport for this SAPMP update; the current conditions were determined using the collected PCI distress data. PCI values were computed and used to identify pavement facilities that were below the defined critical PCI as sections that would benefit from immediate major rehabilitation activity. These pavement sections that were determined to be below the critical PCI would most likely benefit from long-term major rehabilitative construction activity rather than localized, short-term maintenance and repairs.

The Year-1 Major Rehabilitation Needs, or projects that are recommended to be completed because the pavement is below the critical PCI, were developed on the assumption that there is an unlimited repair budget. These projects include:

- Runway 5-23 Sections 6315, 6310, and 6305
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Runway 9R-27L Sections 6210 and 6205
  - Reconstruction attributed to distresses related to loading, climate, and age of pavement.
- Hold Apron Taxiway A Section 5105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- T-Hangar Apron Section 4205
  - Mill and Overlay attributed to distresses related to loading, climate, and age of pavement.
- North Apron Section 4105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- North Apron Sections 4110 and 4132
  - Reconstruction attributed to distresses related to loading and construction quality.
- North Apron Sections 4127, 4125, 4120, and 4115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, PCC pavement growth, and age of pavement.
- Taxiway G Section 710
  - Reconstruction attributed to distresses related to subgrade quality, climate, and age of pavement.

- Taxiway G Section 705
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway F Section 610
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway C3 Sections 320 and 315
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway C2 Section 310
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway A3 Section 115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.

The section level projects that were identified as Year-1 Major Rehabilitation Needs are in Table III.

Branch ID	Section ID	Major Rehabilitation Costs	PCI Before M&R	Rehabilitation Activity	PCI After M&R
RW 5-23	6315	\$3,536,199.63	56	Mill and Overlay	100
RW 5-23	6310	\$549,999.97	50	Mill and Overlay	100
RW 5-23	6305	\$299,999.99	59	Mill and Overlay	100
RW 9R-27L	6210	\$2,626,767.47	28	Reconstruction	100
RW 9R-27L	6205	\$5,253,534.79	24	Reconstruction	100
AP H TW A	5105	\$391,095.24	28	Reconstruction	100
AP T-HANG	4205	\$1,209,799.94	51	Mill and Overlay	100
AP N	4132	\$302,220.07	19	Reconstruction	100
AP N	4127	\$63,968.80	51	Mill and Overlay	100
AP N	4125	\$249,879.61	49	Mill and Overlay	100
AP N	4120	\$45,970.70	52	Mill and Overlay	100
AP N	4115	\$384,840.09	44	Mill and Overlay	100
AP N	4110	\$4,339,696.48	20	Reconstruction	100
AP N	4105	\$371,376.54	36	Reconstruction	100
TW G	710	\$516,700.62	27	Reconstruction	100
TW G	705	\$429,334.65	44	Mill and Overlay	100
TW F	610	\$338,097.82	48	Mill and Overlay	100
TW C3	320	\$59,330.90	46	Mill and Overlay	100
TW C3	315	\$414,907.98	60	Mill and Overlay	100
TW C2	310	\$306,191.39	59	Mill and Overlay	100
TW A3	115	\$546,377.27	51	Mill and Overlay	100
	Total =	\$22,236,289.95			

#### Table III: Year-1 Major Rehabilitation Needs for Bartow Municipal Airport

The SAPMP uses historic pavement condition data from the previous inspections to develop pavement performance models. These pavement performance models are used to create PCI prediction curves to estimate future pavement conditions based on the historic trends. The section areas, prediction curves, and current condition data were used to develop a 10-year major rehabilitation program. Major rehabilitation costs for each year of the 10-year program are based on general unit costs for pavement repairs and not detailed cost estimates that are typically prepared for a construction set of bid documents. Additionally, preventative maintenance level repair budgets were estimated for a 10-year duration. Table IV provides an annual summary of the 10-year Preventative Maintenance and Major Rehabilitation planning level cost opinions for the airfield pavement facilities at the airport. Refer to Section 6 of this report for additional information.

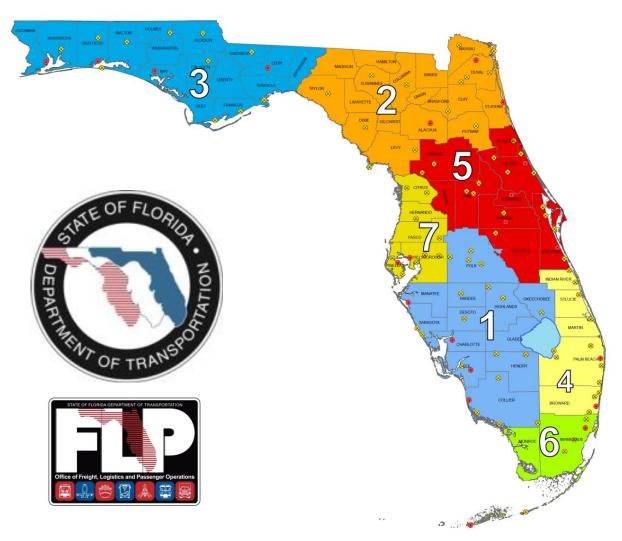

Year	Preventative		Preventative Major M&R		Total Year Cost	
2014	\$	287,102.73	\$	22,236,289.95	\$	22,523,392.68
2015	\$	302,165.35	\$	1,505,011.52	\$	1,807,176.87
2016	\$	372,065.88	\$	62,573.36	\$	434,639.24
2017	\$	439,849.34	\$	558,837.72	\$	998,687.06
2018	\$	530,355.93	\$	841,526.58	\$	1,371,882.51
2019	\$	673,669.16	\$	347,782.21	\$	1,021,451.37
2020	\$	795,020.38	\$	1,337,135.52	\$	2,132,155.90
2021	\$	959,184.18	\$	298,249.81	\$	1,257,433.99
2022	\$	1,118,487.49	\$	-	\$	1,118,487.49
2023	\$	1,255,581.65	\$	-	\$	1,255,581.65
Total		\$6,733,482.09		\$27,187,406.67	\$	33,920,888.76

The success of the repair program for your airport depends on the timely implementation of preservation, localized maintenance and repairs, and major rehabilitation work activities. If work is completed as scheduled, your airport will probably experience an improvement to the overall area-weighted average PCI. Though this analysis was performed with the assumption of an "unlimited budget", the purpose has been to identify specific projects over the course of 10-years for each pavement section where the condition is projected to fall below the critical PCI. The costs depicted in this study are intended to aid the airports in planning level budgets. Prior to construction work, it is recommended that the airport perform additional investigation at the design level to better estimate costs associated with the maintenance, repair, and major rehabilitation activity discussed.

# C THE OFFICE

# 1. INTRODUCTION

The State of Florida has more than 100 public airports that are vital to the Florida economy as well as the economy of the United States. The aviation system in Florida allows the State to capitalize on an increasingly global marketplace. Florida's system of commercial service and general aviation airports are important to businesses throughout the entire State. Air travel is essential to tourism, Florida's number one industry.

There are millions of square feet of pavement infrastructure that consists of runways, taxiways, aprons, ramps, and other areas of airports that are vital to the support and safety of aircraft operations. Timely pavement maintenance repair and major rehabilitation of these pavements will support the airport in operating safely, efficiently, economically and without excessive down time.

The Florida Department of Transportation (FDOT) Central Aviation Office implemented the Statewide Airfield Pavement Management Program (SAPMP) in 1992. In 2012, the FDOT Central Aviation Office selected a team led by Kimley-Horn and Associates, Inc. and including Peneul Consulting, LLC, Roy D. McQueen & Associates, LTD, and All About Pavements, Inc., to provide services in support of the Central Aviation Office Program Manager. The continued evaluation and update of the existing SAPMP is to be completed over fiscal years 2013 and 2014.

This individual airport airfield pavement evaluation report discusses the work performed, a summary of findings, condition analysis results, and recommendations for maintenance repair and major rehabilitation planning associated with the SAPMP update. It also briefly describes the procedures used to ensure that the appropriate engineering and scientific standards of care, quality, budget, schedules, and safety requirements were implemented during the performance of this work.

## 1.1 Purpose of Pavement Evaluation Report

The purpose of this Airfield Pavement Evaluation Report is to:

- Describe, briefly, the SAPMP goals, procedures, and responsibilities of the program's participants.
- Provide a brief technical explanation on pavement management principles, standard practices, objectives, and benefits of implementation.
- Outline procedures used to coordinate, collect, evaluate and report pavement inspection results at this airport.
- Analyze and utilize condition results for the development of maintenance, repair, and major rehabilitation based on pavement performance trends.

# 1.2 FDOT Statewide Airfield Pavement Management Program

In 1992, the FDOT implemented the SAPMP to improve the knowledge of pavement conditions at public airports in the Florida Airports System, identify maintenance and rehabilitation needs at each airport, automate pavement infrastructure information management, and establish standards to address future needs. The 1992 SAPMP implementation provided the FDOT and the participating airports valuable information for establishing and performing timely and appropriate pavement rehabilitation.

During the 1992-1993 implementations and again during the 1998-1999 updates; the SAPMP performed the development of proprietary software for pavement

management system analysis. This development allowed for the creation of pavement management database file system populated with airport attributes and condition data. The pavement management database was used to establish maintenance, repair, and rehabilitation (M&R) policies, M&R budget costs, and the development of recommendations for performing routine pavement preservation maintenance. This system, known as AIRPAV, was initially developed during the 1992-1993 SAPMP implementation for the analysis of distress data. The AIRPAV system was used again in the 1998-1999 SAPMP update.

In 2004, the SAPMP update included the review of the AIRPAV software compared to other industry available non-proprietary software packages. As a result of this review, MicroPAVER was selected for implementation of the system update. MicroPAVER was developed by the U.S. Army Corps of Engineers Construction Engineering Research Laboratory for the purpose of pavement management. Data from the 1998-1999 FDOT SAPMP update, which was built upon the initial 1992-1993 implementation of AIRPAV, was reviewed and converted to be compatible with the MicroPAVER system. This data conversion included all documented pavement facility, classification, type, history, geometry, PCI condition data and pertinent attributes gathered from airport feedback at the time. This information was used to develop the inventory of each participating airport's pavement facilities in a consistent format. This was the development of Airfield Pavement Network Definition Exhibits. These inventory exhibits visually depicted the branch, section, and sample units that were based upon the pavement construction history and composition information provided by each airport.

In 2006-2008, the SAPMP was updated again with continued use of the MicroPAVER system. Based on the distress data collected, a maintenance repair and major rehabilitation planning program was developed for each airport. As part of this SAPMP update, the procedures for the inspection and the collection of the pavement distress data were documented, and an interactive website (http://www.dot.state.fl.us/aviation/pavement.shtm) was established for input of data.

In 2010-2012, the SAPMP was updated using new GPS integrated technology to digitally collect pavement distress data. Interactive GIS map files were developed from updated Airfield Pavement Network Definition Maps to aid pavement condition inspectors in the collection of sample distress data. The data collected was utilized to develop pavement performance models to predict future pavement PCI values and make recommendations for major rehabilitation.

Currently, airports participating in the Airport Improvement Program (AIP) Grant Program are required by the Federal Aviation Administration (FAA) to develop and implement a pavement maintenance program to be eligible for funding (FAA Advisory Circular 150/5380-6B *Guidelines and Procedures for Maintenance of Airport Pavements*). This program requires detailed inspection of airfield pavement conditions by trained personnel. The inspections are required to be performed at least once a year or every three years, if the pavement is inspected in accordance to the PCI survey procedure (such as ASTM International D 5340 *Standard Test Method for Airport Pavement Condition Index Surveys*). The previous 2010-2012 SAPMP update utilized the ASTM D 5340-04 released in 2004, in lieu of the 2010/2011 edition, in order to maintain consistent database integrity and benefit of pavement performance models from previous inspections.

# 1.3 Organization

## FDOT Central Aviation Office Program Manager

The FDOT Central Office Airport Engineering Manager serves as the Aviation Office Program Manager (AO-PM) for the SAPMP. The AO-PM monitors the work performed by the Consultant. The AO-PM has review and approval authority for each program task and manages the day-to-day details of the SAPMP and the pertinent updates.

The AO-PM reports updates and milestones to the FDOT State Aviation Manager and Aviation Development Administrator.

## Consultant

The Consultant, Kimley-Horn and Associates, Inc. and their team consisting of Peneul Consulting, LLC, Roy D. McQueen & Associates, LTD, and All About Pavements, Inc. provide technical and administrative assistance to the AO-PM during the execution of the update to the SAPMP. The efforts include updating the airport pavement inventory data, performing the condition survey inspections, evaluating the airfield pavement conditions and updating the SAPMP based upon procedures outlined in the FAA Advisory Circular 150/5380-6B Guidelines and Procedures for Maintenance of Airport Pavements and ASTM D 5340.

#### Airport Role

The airports are the ultimate client for each condition survey inspection performed at their respective airfields as part of the SAPMP. The individual airports will be provided final deliverables prepared by the Consultant that have been reviewed and approved by the AO-PM. The airport should provide a current Airport Layout Plan (ALP) to the Consultant and, if they participated in the previous SAPMP, indicate any construction activity that has been performed since the previous inspections.

#### FDOT District Offices

The seven FDOT District Offices, specifically the Aviation Representatives, provide vital support to the SAPMP update and the AO-PM. Each District supports the SAPMP's on-going efforts of provided representative construction trend costs and practices through the Florida Airports System. Each District Office receives copies of individual Airfield Pavement Evaluation Reports for the airport facilities located within their respective districts.

## 1.4 Introduction to Pavement Types and Pavement Management

#### **Pavement Basics**

A pavement is a prepared surface designed to provide a continuous smooth ride at all taxi, takeoff, and landing speeds and to support an estimated amount of traffic loading for a certain number of years. Pavements are composed of a combination of constructed layers of subgrade soils, subbases, base course material, and surface level courses. There are mainly two types of pavements:

- Flexible Pavement, a composition of bituminous asphalt concrete (AC) surface, base, and subbase layers.
- Rigid Pavement, a composition of Portland Cement Concrete (PCC) surface, base, and subbase layers.

Both pavement types use a combination of layered materials and thicknesses in order to support the traffic loads (both magnitude and repeated application) and protect the underlying subgrade soil. Flexible pavements dissipate applied loads from layer to layer until the load magnitude is small enough to be supported by the subgrade soil. In rigid pavements, the PCC layer supports the majority of the structural load applied, and the base or subbase layer is constructed to provide a smooth, level, and continuous platform that provides uniform support for PCC slabs. A small percentage of airfield pavements within the Florida Airports System are composed of hybrid 'composite pavement' sections that may include both AC pavement and PCC pavement. The two known composite pavements are AC surface over PCC (APC) and PCC over AC (White Topping).

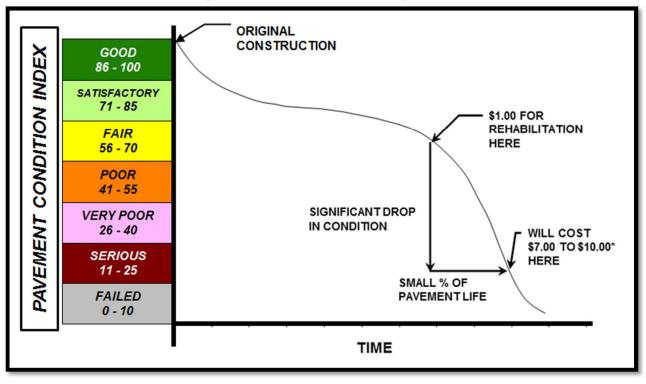

Due to the different nature of the pavement types, construction, and their materials; flexible and rigid pavements have different modes of failure and fatigue. This results in varying deterioration and distress development. Understanding the mechanics and modes of failure of the pavement types will assist the engineers in making timely, adequate, consistent, and economical maintenance repairs and major rehabilitation to the pavement structures at each airfield.

#### The Concept of an Airfield Pavement Management System

The SAPMP is a program that provides the Florida Airports System an opportunity to implement and/or maintain a proactive Airfield Pavement Management System (APMS) in a consistent manner at a regular schedule. The SAPMP Airfield Pavement Management System consists of pavement inventory, pavement construction and history, condition survey inspections, pavement performance modeling, maintenance recommendations, and major rehabilitation planning. The various elements of the APMS are used by experienced engineers to identify critical pavement preservation pavements, make or rehabilitation recommendations, and approximate pavement performance. The APMS as a whole is used by an airport's stakeholders, managing agencies, engineers, and planners as a tool in decision making for future project planning, budgeting, and scheduling of activities for its airfield pavement infrastructure.

A benefit of an active APMS is it provides an understanding of an airport's pavement performance trends for the purpose of project planning. Based on the performance trend of their pavements, an airport can schedule pavement maintenance and rehabilitation prior to when the pavement section has deteriorated to a condition that would require reconstruction. The use of pavement performance trends will help airports plan M&R and Rehabilitation projects in a manner and sequence that maximizes benefit and minimizes costs. Figure 1-1, which is based upon the FAA Advisory Circular 150 5380-7A Airport *Pavement Management Program*, illustrates how pavement generally deteriorates over time and the relative cost of rehabilitation and reconstruction throughout its life.

## Figure 1-1: Pavement Life Cycle

Source: FAA Advisory Circular 150 5380-7A Airport Pavement Management Program

Note that during approximately the first 75% of a pavement's life, it performs relatively well. After that, however, it begins to deteriorate rapidly. The number of years a pavement stays in 'Good' and 'Satisfactory' conditions depends on how well it is proactively maintained. As the Figure 1-1 demonstrates, the cost of maintaining the pavement above critical condition before rapid deterioration occurs is much less compared to maintaining pavements after substantial deterioration has occurred.

Pavements tend to deteriorate at an accelerated rate when actual traffic loading exceeds the original design assumptions and when limited resources are available for maintenance and repair (M&R) efforts. Planned maintenance and rehabilitation, essentially preserving pavements and delaying condition deterioration, help airport (managers, agencies, and engineers) maximize the use of their budgets and prolong the life of their pavements. An APMS provides a tool to schedule planned maintenance and major rehabilitation efforts based on a consistent methodology of condition assessment. This consistent methodology of pavement condition assessment allows for the development of pavement performance models to help forecast future pavement conditions.

Part of the implementation of the APMS is the clear identification and inventorying of pavement infrastructure that needs to be managed specifically within the airport (owner, manager, and agencies) responsibility. Another aspect of the APMS is development of maintenance, repair, and major rehabilitation policies that align with the expectations of pavement performance and are based on ability to fund the types of work identified. Once there is an understanding of the cause and extent of pavement distresses, appropriate maintenance and rehabilitation can be planned. By using representative construction costs based on historic bid trends; planning level budget costs can be developed on a multiyear duration.

#### Airfield Pavement Inspection Methodology for the SAPMP

Pavement condition assessment requires the application of professional judgments regarding the condition of the pavement. The SAPMP airfield pavement condition survey inspections assess pavement, comparing it to a set of standards in ASTM D 5340-11. As part of this update, SAPMP has adopted the changes made in updates to ASTM D 5340-11. These include the separation of Weathering and Raveling into two distinct flexible pavement distresses, and the addition of the Alkali-Silica Reactivity distress for rigid pavement distresses. The change in distress classification, as described in ASTM D 5340-11, may result in small variances in the PCI values from the previous inspection analysis.

The pavement condition surveys assess the functional condition of the pavement surface based on surface distresses as defined by the ASTM D 5340-11. Typically, deficiencies within a pavement structure will eventually reflect to the pavement surface as distresses described within ASTM D 5340-11. The SAPMP is specifically a visual evaluation and analysis based on the ASTM D 5340-11. The structural condition and relative support of the pavement layers can be directly quantified using non-destructive deflection testing (NDT) as well as other indepth engineering evaluation or sampling and testing methods.

For the SAPMP update, only visual surveys were performed. Further structural and geotechnical testing should be conducted to determine design level rehabilitation and/or reconstruction needs should the airport proceed to the design process.

In preparation for the PCI survey inspections, the airfield pavements for each airport are divided into branches, sections, and sample units as established by FAA Advisory Circular 150/5380-6B and ASTM D 5340. Further discussion of the process of inventorying and categorizing pavement facilities by use,

composition, and history can be found in SECTION 2 AIRFIELD PAVEMENT NETWORK DEFINITION and PAVEMENT INVENTORY.

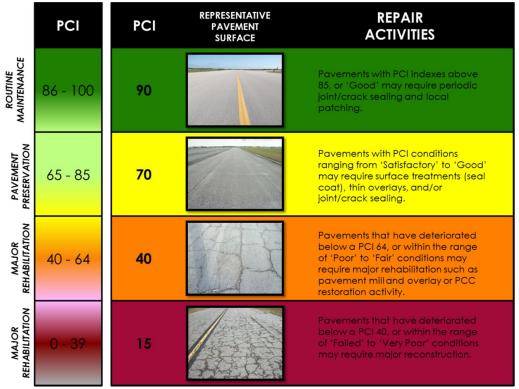

Sample units are uniformly divided areas of pavement that are defined for inspection. Sample unit sizes are approximately  $5,000 \pm 2,000$  square feet for flexible AC pavements and  $20 \pm 8$  slabs for rigid PCC pavements. Prior to conducting the field condition survey inspections, the sampling plan was developed for the airfield pavements based on updates to the previous inspection sampling based on the available knowledge of construction updates. The sample rate adopted for the SAPMP is depicted on Table 1-1.

Flexible Pavements Asphalt Concrete				Rigid Pavements Portland Cement Concrete			
	Number of Sample Units to Inspect				Number of Sample Units to Inspect		
Number of Sample Units in Section	Runway	Taxiways, Aprons, Others		Number of Sample Units in Section	Runway	Taxiways, Aprons, Others	
1 - 4	1	1		1 - 3	1	1	
5 - 10	2	1		4 - 6	2	1	
11 - 15	3	2		7 - 10	3	2	
16 - 30	5	3		11 - 15	4	2	
31 - 40	7	4		16 - 20	5	3	
41 - 50	8	5		21 - 30	7	3	
				31 - 40	8	4	
≥ 51	20% but ≤	20% but ≤ 10% but < 10		41 - 50	10	5	
≥ 51	$10\% \text{ but} \le 10$			≥ 51	20% but ≤ 20	10% but ≤ 10	

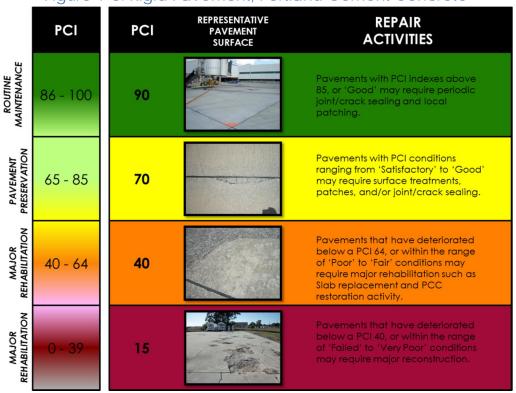

### Table 1-1: Sampling Rate Schedule for SAPMP PCI Survey Inspections

The sample units to be inspected were determined through a systematic random sampling technique to provide an unbiased representation of sample units for each pavement facility. The sample unit locations had been determined in such a way that they are distributed evenly throughout each defined pavement section area. In certain cases when no representative distresses are observed in the field, additional sample units were added.

The distress quantities and severity levels from each inspected sample unit are used to compute the PCI value and rating for each Section using the ASTM D 5340-11 and MicroPAVER software. Figures 1-2 and 1-3 depict graphical representations of the color ranges associated with PCI values and ranges with a photograph of airfield pavement that exhibited the conditions for both flexible and rigid pavements respectively.

#### Figure 1-2: Flexible Pavement, Asphalt Concrete

Using the ASTM D 5340-11 standard seven qualitative ranges, the SAPMP provides a PCI value and a standard qualitative condition rating for the pavement facilities inspected.

# 2. AIRFIELD PAVEMENT NETWORK DEFINITION AND PAVEMENT INVENTORY

Bartow Municipal Airport (BOW), located in Bartow, Florida, is controlled by the Bartow Municipal Airport Development Authority and focuses primarily on serving general aviation aircraft. The airport has three asphalt runways (two parallel and one cross-wind). These runways are Runway 9L-27R (5,000'x150'), Runway 5-23 (5,000'x100'), and Runway 9R-27L (4,400'x150'). Runways 9L-27R and 5-23 are both served by partial parallel taxiways, with taxiways connecting all of the runway approach ends to the main ramp which is located to the north of the airfield.

It is important to note that the aforementioned runway data in addition to the remaining airfield pavement facilities geometric attributes may vary slightly from the geometry used in the condition exhibit in Appendix B and the major rehabilitation exhibit in Appendix F based on field measurements.

Land acquisition for the airport began under the supervision of the mayor of the city of Bartow in 1941. The airport construction was taken over by the US Government in 1942 and the airport served as a training station for the US Army Air Forces. The airfield was used to train on both bombardment aircraft and fighters throughout World War II. The airport was deactivated and returned to the city of Bartow in 1945. However, the US Department of Defense again took control of the airfield in 1950 and it served as a primary pilot training school. The city again regained control of the airport in 1960. In July 1967, a city ordinance was passed establishing an airport authority after the city had attained approval from the Federal Aviation Administration. Bartow Municipal Airport is designated as a General Aviation (GA) airport and is located in District 1 of the Florida Department of Transportation.

## 2.1 Network Definition

The airfield pavements within each airport network are separated into manageable units within the FDOT SAPMP MicroPAVER database system, organizing pavement data by similar use and constructive history.

#### Branch and Section Identification

Each airport's airfield pavement network is generally subdivided into separate Branches (runways, taxiways, aprons/ramps, or others) that have distinctly different functional identifications and uses. Each Branch is further subdivided into Sections as defined by pavement location, composition, and construction history. A Section is typically understood to be a project level subdivision within a Branch feature. Sections are manageable units to organize data collection and are treated individually during the maintenance and major rehabilitation planning process. A pavement rank (primary, secondary, or tertiary) is assigned to each Section based on its importance and type of use to airport operations. The pavement rankings designated for each section at this airport were defined by the previous SAPMP, unless changes were communicated by the airport. These Sections are further subdivided into condition survey sample units based on the methodology described in ASTM D 5340.

#### Airfield Pavement System Inventory and Network Definition Update

The Airfield Pavement System Inventory and Airfield Pavement Network Definition Exhibits are developed individually for each participating airport. Based on information requested of and provided by the airport, the airfield pavements are evaluated on designation updates, and recent or anticipated pavement construction activity. As mentioned previously, a Section is defined partially by its construction history; this variable that factored in the performance and condition of the pavement section.

The Airfield Pavement System Inventory Exhibit, Figure A-2 in Appendix A, is a snapshot of recent and anticipated airfield pavement construction activity communicated by the airport since the last SAPMP update. Construction activities identified include maintenance and repair activity, major rehabilitation, and airfield pavement expansion efforts. Maintenance and repair activity may include; surface treatments, crack sealing, patching, slab replacement, and others. Both maintenance and rehabilitation activities are identified at the pavement section level. This type of work may result in an increase in overall Section PCI since the last inspection. Major rehabilitation efforts may include; asphalt milling and overlay, and full depth pavement reconstruction. This type of effort will result in a resetting of the pavement section PCI value to 100 due to the nature of the work. Lastly, airfield pavement expansions are accounted for as new inventory and assigned a section PCI of 100. Typically the new pavement sections are not inspected due to its condition; however these pavements are incorporated into the SAPMP pavement database. When possible, these changes are reflected in the Airfield Pavement Network Definition Exhibit, in Appendix A, prior to the field inspection. The

updates are typically discussed and confirmed with airport personnel at the beginning and end of condition survey inspections to ensure accuracy.

The Airfield Pavement Network Definition Exhibit depicts the airport's pavement limits with Branch and Section delineations. This exhibit also includes the subdivision on Section areas into sample units and is used to identify those sample units that are to be inspected. The previous SAPMP Airfield Pavement Network Definition Exhibits were used as a base. Updates and information provided by each airport was reviewed and the exhibits were revised appropriately. Characteristics that are considered include; airfield configuration, branch designations (magnetic declination, Airport Layout Plan updates) and pavement composition. The exhibit serves not only as a primary guide for the airfield inspectors but also allows specific distresses found in the re-inspection report to be geographically located.

Due to recent and anticipated construction efforts; pavement area sections may have been consolidated and created which will affect the total number of sample units to be inspected based upon the methods described in ASTM D 5340 and from the sampling rate schedule. Table 2-1 summarizes the recent and anticipated airfield pavement construction efforts communicated by the airport.

Construction Year	Section Location	Work Type/Pavement Section
2011	Taxiways A, H & Apron N	REHAB WITH OVERLAY, CRACK SEALING, ECT/ 105, 110, 802, 805 AND 4105

2014	ga Apron	PCC SLAB REPLACEMENT

Table 2-1: Recent	and/or Anticipated	Airfield Pavement	Construction

## Airfield Pavement Network Definition & Geographic Information System (GIS)

As part of this SAPMP update, geographic information system (GIS), global positioning system (GPS), and digital data collection were integrated into the Pavement Inspection Methodology at each airport. Using AutoCAD Civil 3D, ArcMap, ArcPad, and FDOT Survey and Mapping Office Aerial Photography; digital navigation maps have been developed for each airport to represent the SAPMP pavement inventory attributes. These navigation maps were used with field data tablets to assist survey teams as they performed condition inspections by navigating pavement infrastructure and collecting distress data.

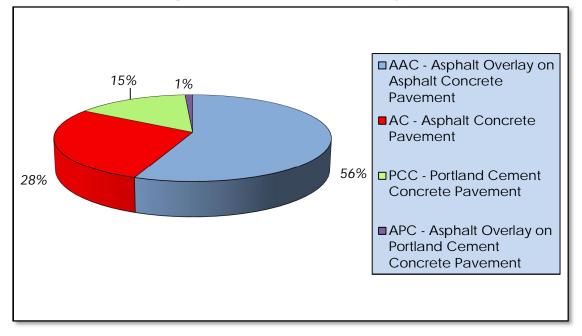

## 2.2 Pavement Inventory

The detailed pavement inventory database was updated to reflect the Airfield Pavement Network Definition Exhibit, in Appendix A, updates and field inspection results. Table 2-2 and Figure 2-1 provides a summary of the pavement inventory attributes at Bartow Municipal Airport-(BOW) for this SAPMP update.

Table 2-2. Lavement inventory Summary						
Airfield Pavement Network Definition						
Number of Branches	18

Note: If new construction, then survey date = last construction date and PCI is set to 100 by MicroPAVER. \* Sections not surveyed due to reasons such as re-sectioning, no escort, not accessible at the time of survey.

# 3. AIRFIELD PAVEMENT CONDITION

Airfield pavement distresses and condition were surveyed in accordance with the methods outlined in FAA Advisory Circular 150/5380-6B and ASTM D 5340-11. These procedures define distress type, severity, and quantity for sampling areas within each defined pavement section area to analyze and determine the PCI value and condition rating.

The program has been updated from ASTM D 5340-04, released in 2004, to ASTM D 5340-11, released in 2011, for this SAPMP update. The primary updates include the separation of certain distress types and the addition of new types with corresponding changes to PCI calculation. These changes in distress classification may result in small variances in the PCI values from the previous inspection analyses.

## 3.1 Inspection Methodology

A pavement condition survey inspection is performed by measuring the amount and severity of defined pavement distresses observed within the boundaries of sample units. These distresses, as defined by ASTM D 5340, are generally caused by traffic fatigue loading, exposure to climate and elements, and other airfield specific factors. This data is collected by field personnel experienced in pavement condition survey inspection. Data collection is then transferred into the FDOT MicroPAVER database system. MicroPAVER is used to calculate PCI values using the methodology described in ASTM D 5340-11. The values are calculated for each sample and extrapolated on a Section level to determine an area-weighted PCI value ranging from 0 to 100 and one of seven condition ratings. Tables 3-1 and 3-2 describe the distresses as defined by the ASTM D 5340-11 and adopted for the SAPMP procedures.

Code	Distress	Primary Mechanisms
41	Alligator Cracking	Load / Fatigue Failure
42	Bleeding	Construction Quality/ Mix Design
43	Block Cracking	Climate / Age
44	Corrugation	Load / Construction Quality
45	Depression	Subgrade Quality
46	Jet Blast	Aircraft
47	Joint Reflection - Cracking	Climate / Prior Pavement
48	Longitudinal/Transverse Cracking	Climate / Age
49	Oil Spillage	Aircraft / Vehicle
50	Patching	Utility / Pavement Repair
51	Polished Aggregate	Repeated Traffic Loading
52	Raveling	Climate / Load
53	Rutting	Repeated Traffic Loading
54	Shoving	PCC Pavement Growth / Movement
55	Slippage Cracking	Load / Pavement Bond
56	Swelling	Climate / Subgrade Quality
57	Weathering	Climate

## 3.2 Airfield Pavement Condition Index Rating Results

From the condition survey inspection performed in 2013 at Bartow Municipal Airport, the overall weighted average PCI value is 61 representing a condition rating of FAIR.

The airport's airfield pavements exhibited distresses typically associated with climate and age based distresses. The predominant AC and AAC pavement distresses observed include: swelling, weathering, depressions, longitudinal/transverse cracking, block cracking, and raveling. The predominate PCC pavement distresses observed includes: joint seal damage, map cracking, joint spalling, corner spalling, longitudinal/transverse/diagonal cracking, shattered slabs, and faulting.

Runway 9L-27R exhibited age and climate related distresses including low severity longitudinal/transverse cracking along with low and medium severity weathering. A couple instances of low severity swelling and depressions were also observed in multiple locations on the runway section.

Runway 9R-27L had the oldest AC pavement of all of the runways which was evident in the pavement distresses observed. Low and medium severity block cracking along with raveling were the common distresses throughout, with low severity longitudinal/transverse cracking also being noted in places. The 27L approach end of the runway currently is composed of PCC pavement and exhibits high severity joint seal damage, low and medium severity map cracking along with low severity joint spalling, corner spalling, patching and shrinkage cracking.

Runway 5-23 exhibited low and medium severity longitudinal/transverse cracking, low and medium severity swelling and raveling ranging from low to high severity. Low severity weathering was also observed throughout the runway section.

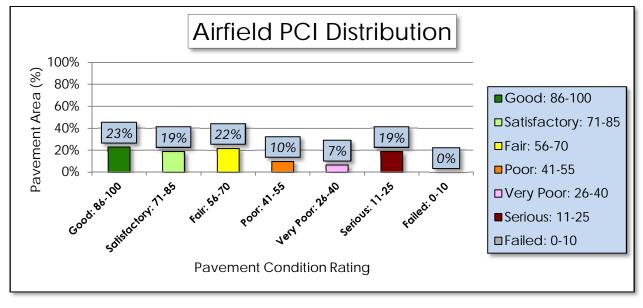

Runway 5-23's partial parallel taxiway (A1 and A2) was rehabilitated in early 2012 and was not inspected due to its recent construction.

The main ramp area consisted primarily of PCC pavement dating back to the 1940's. The pavement distresses observed reflected the pavements age, including: low and medium severity longitudinal/transverse/diagonal cracking, low, medium and high severity patching, low and medium severity joint and corner spalling along with low severity faulting, shattered slabs, map cracking, and joint seal damage. The apron AC pavements exhibited low and medium severity longitudinal/transverse cracking, depressions, patching, weathering, raveling, block cracking, shoving and swelling.

Taxiways C1, C2, C3, A2, A3 and D1 all exhibited similar AC pavement distresses ranging from low and medium severity longitudinal/transverse cracking along with low severity raveling, weathering and swelling.

Appendix B contains Table B-1 and an Airfield Pavement Condition Index Rating Exhibit, Figure B-1, which depicts the PCI results by Section, and Appendix C contains MicroPAVER reports of PCI results by Branch and Section. Appendix H includes detailed distress data generated by MicroPAVER for each inspected sample unit. The pavement condition at Bartow Municipal Airport is represented in Figure 3-1 in accordance with the condition categories and PCI scale referenced in ASTM D 5340. Further detail is provided in Table 3-3 which describes the breakdown of the airport's airfield conditions according to area and use.

Appendix B contains Table B-1 summarizes the Section Condition values and the Airfield Pavement Condition Index Rating Exhibit, Figure B-1, that depicts the PCI results by Section. Appendix H is dedicated to the reporting of the specific airfield pavement distress data collected at the time of the inspection for this update.

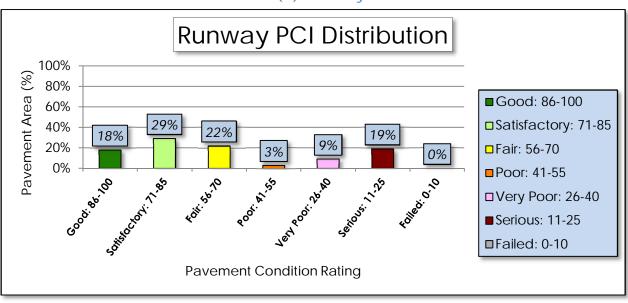

## Figure 3-1: Airfield Pavement Condition Index Rating Summary

Table 3-3: Pavement Condition index Rating Summary						
Airfield Pavement Use						
Use	Average Area- Weighted PCI	Condition Rating				
Runway	61	FAIR				
Taxiway	75	SATISFACTORY				
Apron	49	POOR				
	Condition Area					
Condition Rating	Area (SF)	Relative Area (%)				
Good	802,333	23%				
Satisfactory	656,227	19%				
Fair	740,870	22%				
Poor	363,421	10%				
Very Poor	260,396	7%				
Serious	659,697	19%				
Failed	-	0%				

## Table 3-3: Pavement Condition Index Rating Summary

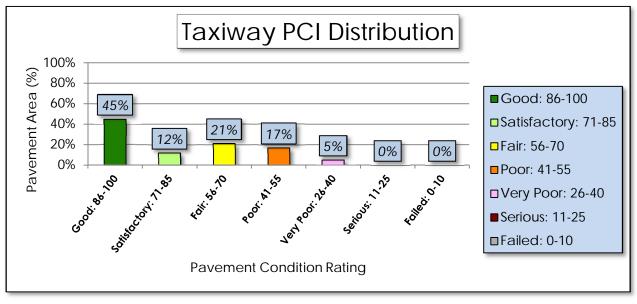

Approximately 42% of the airfield network is in Good and Satisfactory condition; while 36% of the network is in a Poor to Serious condition. Table 3-3 provides a breakdown of total area for each pavement by condition rating. Figures 3.2 a, b, c depict the condition rating of the airfield pavement by Branch Use. Photographs taken during the condition survey inspection are included in Appendix G. The photographs included are intended to be representative of the distress observed.

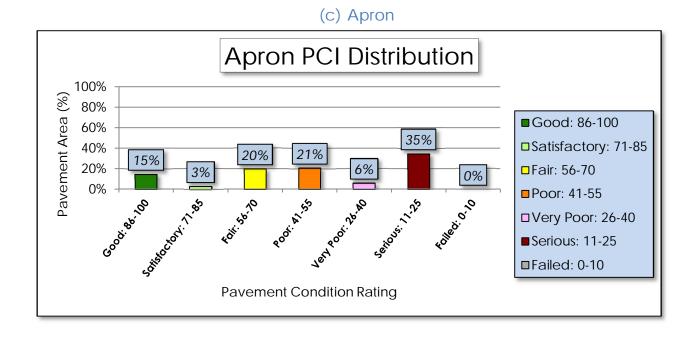

#### (a) Runway

#### (b) Taxiway

Pavement performance models are developed from the distress data collected for the SAPMP for the Florida Airports System. This data is consolidated in a database and organized by inspection date, pavement type, age, pavement use, and airport category. The pavement performance models are used to develop broad prediction models, also known as pavement condition deterioration curves.

The consolidation of the Florida Airports System's pavement infrastructure within the FDOT SAPMP is based on data that have been collected in a consistent method of measurement. The historic pavement condition, or performance trend, has been compiled throughout the system with data from the inception of the SAPMP. This data is processed into models that have been analyzed and developed into prediction curves based upon pavement characteristics. These characteristics include; climate, construction material, and operations. Each model has been developed based on the following criteria:

AIRPORT TYPE (Primary, Regional Reliever, or General Aviation)

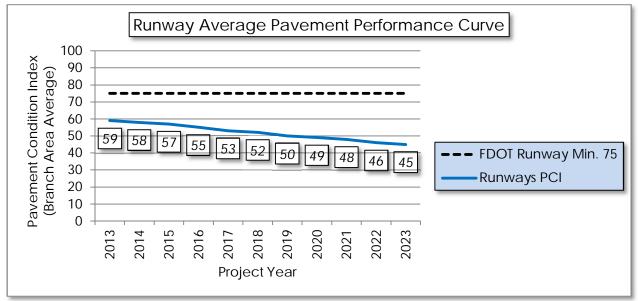

>FACILITY USE (Runway, Taxiway, or Apron)

>>FACILITY SURFACE TYPE (AC, AAC, APC, or PCC)

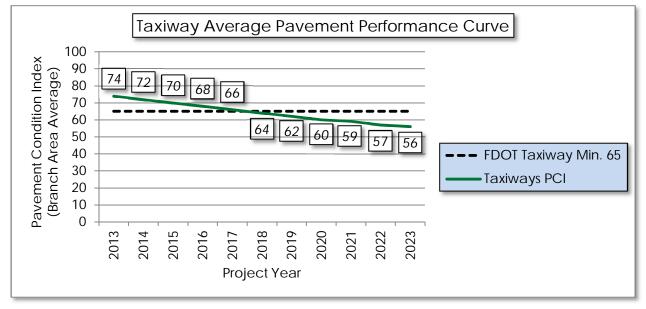

The historic trends of pavement performance at Florida airport facilities for all performance models are consolidated within the program database. This information is utilized in the prediction of pavement performance based on the current PCI determined from the inspections that took place between 2013 and 2014. Major rehabilitation is planned based on the predicted PCI. The intent of this is for both the individual airport and the FDOT District personnel to be aware of anticipated major rehabilitation work based on condition.

Each airport's airfield pavement section condition, for a given inspection year, is one data point that was used as the basis of each performance trend using a performance model based on pavements of similar background. Figures 4-1, 4-2, and 4-3 represent the pavement performance prediction at Bartow Municipal Airport based on pavement use. Each figure depicts the FDOT recommended Minimum Service Level PCI value for each pavement type.

#### Figure 4-2: Taxiway Pavement Performance Prediction Summary

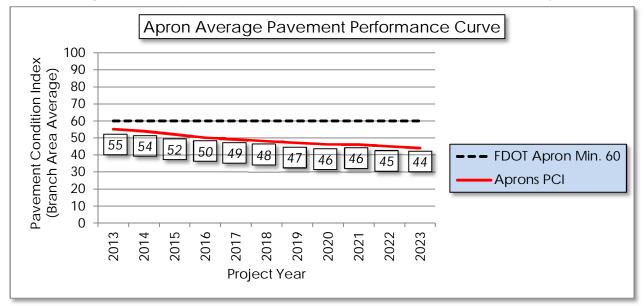

Figure 4-3: Apron Pavement Performance Prediction Summary

Pavement performance modeling to predict the future PCI is primarily done to predict PCI at the Section level for the purpose of planning Major Rehabilitation work. In Appendix D, Table D-1 represents the predicted area-weighted PCI by Section for the airport's airfield pavement infrastructure.

#### 5. AIRFIELD PAVEMENT MAINTENANCE POLICIES AND COSTS

#### 5.1 Policies

Airfield Pavement Maintenance policies are guidance on pavement construction methods used to develop, maintain, repair, and rehabilitate pavement infrastructure based on distresses encountered during the condition surveys.

Maintenance refers to the repair and preservation-type activities that are applied locally to specific distress types on the pavement. These activities for the SAPMP are considered preventative and corrective in nature and are highly recommended to help improve pavement performance and extend pavement life. The SAPMP maintenance policies are based on the FAA Advisory Circular 150/5380-6B and guidance provided in the FDOT Airfield Pavement Repair Manual.

For the purpose of the SAPMP; the maintenance repair needs that are identified and quantified are based solely on the pavement distresses observed and recorded at the time of the inspection. Based on a specific distress type and severity observed, a particular repair work type is recommended and quantified based on the extrapolated section distresses. The repair program identified is specific to the current distresses. Future maintenance planning budgets are based on this initial determination. Tables 5-1 and 5-2 provide the list of maintenance activities incorporated into the SAPMP MicroPAVER database to treat specific distress types and severities.

Surface Type	Distress Code	Distress Name	Severity	Maintenance Work Type	Work Unit	
	41	Alligator Cracking	L, M, H	Full Depth Pavement Patch	Square Feet

Though proactive pavement maintenance and preservation is highly recommended in an APMS; it is recognized that pavement that has deteriorated below a certain PCI will require a major rehabilitation rather than localized maintenance and repair work. Major rehabilitation is recommended when the pavement condition decreases below a critical point such that the deterioration is extensive or the rate of deterioration is so great that maintenance repair efforts are no longer cost-efficient. This critical point is called "Critical PCI". The critical PCI levels for different pavement and branch types were established by the FDOT and were used in this update to develop a maintenance and major rehabilitation plan for the airport. Sections that are above the "Critical PCI" levels will be recommended for maintenance, repair, and preservation treatments, assuming there are no significant load-related distresses. For those Sections below the Critical PCI, the recommended action will consist of major rehabilitation work. This approach is used for the current Section's PCI value and the predicted PCI value for future rehabilitation.

The FDOT has recommended minimum service level PCI for airports based on pavement facility use, airport type, and expected loading frequency. This minimum service level PCI is recommended to ensure the pavement provides a safe operational surface and efficiently uses maintenance and rehabilitation budgets. Separately, the Critical PCI is a value based on historic pavement performance trends and costs. It is at a PCI value of 65, for most airports, at which major rehabilitation is recommended over maintenance level efforts. Table 5-3 identifies the FDOT recommended PCI by use and the critical PCI value for the most important pavements at the airport. This is due to the condition of the pavement and the cost effectiveness of the work. A very important concept of a good pavement management system is the proactive preservation of pavements that are above Critical PCI condition. Conversely, allowing pavement to deteriorate beyond maintenance and performing "worst first" major rehabilitation may cost much more over the life of a pavement.

Use	FDOT Recommended PCI	Critical PCI
Runway	75	65
Taxiway	65	65
Apron	60	65

Table 5-3: Critical and Minimum Service Level PCI for General Aviation Airports

Based on historic trends of pavement performance and industry standard practices in pavement maintenance and rehabilitation, the SAPMP included general guidance on construction activity based on condition PCI, as shown on Table 5-4. It is recommended that further investigation of underlying pavement conditions is performed at the design phase.

Table 5-4: Maintenance and Major Rehabilitation Activity Based on PCI

Category	Activity	PCI Range	
	<ul> <li>Crack Sealing (AC/PCC)</li> </ul>		
Maintenance	<ul> <li>Partial Depth Patching (AC)</li> </ul>	75 - 90	
Maintenance	<ul> <li>Full Depth Patching (AC/PCC)</li> </ul>	75 - 90	
	<ul> <li>Surface Treatment (AC)</li> </ul>		
	<ul> <li>Mill and Overlay (AC)</li> </ul>		
Rehabilitation	<ul> <li>Concrete Pavement Restoration (PCC)</li> </ul>	40 - 74	
	<ul> <li>Full Depth Pavement Reconstruction</li> </ul>	0 - 39	

The PCI standard scale ranges from a value of 0, typically representing a pavement in a failed condition, to a value of 100 which typically represents a pavement in new or good condition. Generally, airfield pavement sections with

a PCI of 75 or higher that are not exhibiting distresses due to aircraft loading will benefit from maintenance activities such as crack sealing, patching, and surface treatments. Pavement sections with PCI values within the range of 40 to 74 may require major rehabilitation, such as a mill and overlay. Lastly, pavement sections with a PCI value of 40 or less are recommended to undergo pavement reconstruction. Generally pavement reconstruction is the only practical means of restoration due to the substantial distresses observed in the pavement structure. Since PCI values are based solely on the visual determination of pavement distresses and deterioration, this method does not provide a direct measure of structural integrity.

#### 5.2 Unit Costs

The FDOT SAPMP developed and updated the maintenance and major rehabilitation costs based on public cost databases for airport and highway pavement construction. Additionally, cost data collected from FDOT and FAA sponsored projects in the Florida Airports System were utilized to identify construction cost trends across the state.

The maintenance, repair, and preservation activity costs have been updated and developed using readily available construction cost data at the time of this update. The costs depicted in this report for both maintenance and major rehabilitation are intended for planning purposes.

#### 5.3 Maintenance, Repair, and Major Rehabilitation

FDOT recognizes that although pavement mill and overlay is recommended for flexible asphalt concrete pavement within a PCI range from 40 to 74, it is conceivable that airports may not have adequate funding to perform this type of major rehabilitation. A comprehensive surface treatment; such as GSB-88 and Microsurfacing, as a maintenance rehabilitation activity, can be used in lieu of asphalt concrete pavement mill and overlay. However, it should be understood that these measures provide only a short term extension of pavement life. While the cost of surface treatments are significantly lower than that of pavement mill and overlay, it is not intended or implied to be a full rehabilitative measure for long term benefit. Table 5-5 and Table 5-6 provide budget costs associated with the work types shown in the table.

Surface Type	Maintenance Work Type	Cost	Work Unit
	Full Depth Pavement Patch	\$5.00	Square Feet
Concrete APC)	Partial Depth Pavement Patch	\$3.00	Square Feet
alt Co C, AP(	Seal Coat Treatment	\$0.55	Square Feet
e Asph .C, AA	Crack Sealing	\$2.75	Linear Feet
Flexible Asphalt (AC, AAC,	Slurry Seal Coat Treatment	\$0.55	Square Feet
	Grinding / Removal	\$2.10	Square Feet

#### Table 5-5: AC Maintenance Unit Costs

#### Table 5-6: PCC Maintenance Unit Costs

Surface Type	Maintenance Work Type	Cost	Work Unit
	Slab Replacement / Full Depth Patch	\$45.00	Square Feet
	Partial Patch - PCC	\$19.10	Square Feet
nent	Crack Sealing - PCC	\$4.25	Linear Feet
Rigid Pavement (PCC)	Joint Seal Repair (Local)	\$3.00	Linear Feet
Rigid	Slab Stabilization / Slab Jacking	\$45.00	Square Feet
	Micro-mill and Seal - PCC	\$1.00	Square Feet
	Seal Coat Treatment	\$1.00	Square Feet

As part of the SAPMP update, the distress data observed at each airport during the inspection is extrapolated on a section basis to make maintenance recommendations. These recommendations are a direct result of the distress types, severities, and quantities observed at the time of inspection. The maintenance recommendations and planning costs are correlated with the airport's airfield pavement network's overall area weighted PCI and used to plan future maintenance costs. Future maintenance costs are planning budgets that are not specific to a pavement section, but are estimates for the entire airfield. Table 5-7 provides budget costs associated with the rehabilitation activities.

Category	Activity	PCI Range	Cost/SqFt
	<ul> <li>Mill and Overlay (AC)</li> </ul>		\$8.00
Rehabilitation	<ul> <li>Concrete Pavement Restoration (PCC)</li> </ul>	40 - 74	\$10.00
	Full Depth Pavement Reconstruction	0 - 39	\$15.00

#### Table 5-7: Rehabilitation Activities and Unit Costs by Condition for General Aviation Airports

A cost scale has been developed based on PCI to develop planning level budgets for the airfield pavements. The cost scale is adjusted by project year based on an assumed inflation rate of 3%. In Appendix E, Table E-1 summarizes the Year-1 maintenance and repair recommendations based on the most recent inspection. The summary in Table E-1 does not take into account any rehabilitation activities, but rather summarizes preventative activities for all PCI ranges, including below critical PCI sections.

#### 6. MAJOR PAVEMENT REHABILITATION NEEDS

As part of the SAPMP, major pavement rehabilitation planning is developed based on current and predicted PCI in comparison with the Critical PCI. The Critical PCI has been determined based on the historic trends of pavement condition relative to the benefit of maintenance and repair activities. Pavement sections determined to have a PCI less than that of the Critical PCI are assumed to have deteriorated to a point at which maintenance and repair level activity would provide little benefit.

The objective of the major pavement rehabilitation needs analysis is to provide planning level projects within an airport's airfield pavement network. Major rehabilitation activities are recommended when a pavement section has deteriorated below the Critical PCI value from a functionality perspective. In addition, major rehabilitation is also recommended when the Section PCI is above the Critical PCI but the Section has load-related PCI distresses. However, most major rehabilitation work is recommended when the Section PCI is below the Critical PCI, which is when maintenance and repair level activities are not considered to be cost effective.

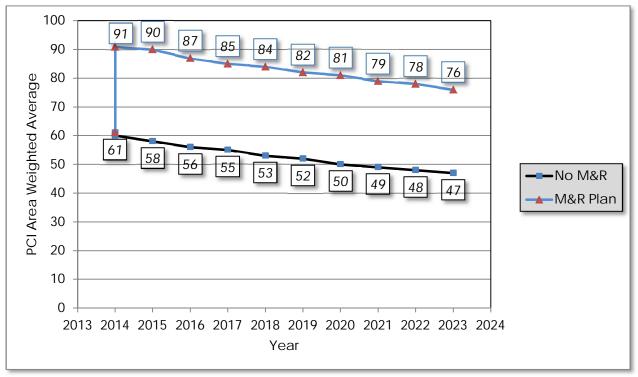

Major rehabilitation is identified within the SAPMP as major construction activity that would result in an improvement or "resetting" of the pavement section's PCI to a value of 100. Such activities could include; mill and hot-mix asphalt overlay and re-construction. This analysis was conducted with no constraints to budgets as a means to identify all pavement projects based on Critical PCI for a 10-year duration. It is recommended that the airport use this as a planning tool for future project development and prioritization. Table 6-1 depicts the major rehabilitation work identified on the pavement section level based on current and predicted pavement PCI.

#### Table 6-1: Summary of Major Rehabilitation

\* Costs are adjusted for inflation at 3%

The 10-year major rehabilitation program addresses those pavement sections that have a current or project PCI that is below the Critical PCI of 65 during the 10-year analysis period. The unconstrained or "unlimited budget" Major Rehabilitation Program is compared to a "No Major Rehabilitation Program" scenario in Figure 6-1. As shown, if no major rehabilitation work is completed in the next 10 years at your airport, the average PCI may be 29 points less than a plan that provides timely repairs to the airfield pavements.

#### Figure 6-1: 10-Year Major Rehabilitation Budget Scenario Analysis

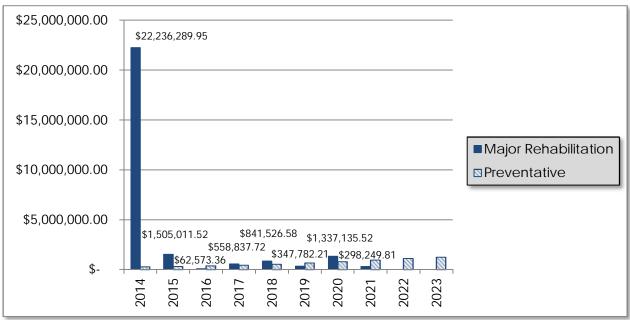

#### 7. PREVENTATIVE AND MAJOR REHABILITATION PLANNING

The preventative and major rehabilitation results include activities that are based on distresses observed and unconstrained by budget limits. FDOT recognizes that the projects identified as Year-1 needs in 2013, based on condition, may exceed a typical annual budget level. It is recommended that each airport further evaluate each project's feasibility and desirability based on the airport's future development plans and budgeting scenarios.

In an effort to identify appropriate budget levels, the 10-year Preventative and Major Rehabilitation analysis evaluated projected budget needs based on predicted PCI of each pavement section. Table 7-1 and Figure 7-1 provides a summary of the expected preventative and major rehabilitation for each program year.

Program Year	Preventative	Major Rehabilitation		Total Year Costs
2014	\$ 287,102.73	\$ 22	2,236,289.95	\$ 22,523,392.68
2015	\$ 302,165.35	\$ 1	,505,011.52	\$ 1,807,176.87
2016	\$ 372,065.88	\$	62,573.36	\$ 434,639.24
2017	\$ 439,849.34	\$	558,837.72	\$ 998,687.06
2018	\$ 530,355.93	\$	841,526.58	\$ 1,371,882.51
2019	\$ 673,669.16	\$	347,782.21	\$ 1,021,451.37
2020	\$ 795,020.38	\$ 1	,337,135.52	\$ 2,132,155.90
2021	\$ 959,184.18	\$	298,249.81	\$ 1,257,433.99
2022	\$ 1,118,487.49	\$	-	\$ 1,118,487.49
2023	\$ 1,255,581.65	\$		\$ 1,255,581.65
			Total =	\$ 33,920,888.76

Table 7-1: 10-Year Preventative and Major Rehabilitation Summary

#### Figure 7-1: 10-Year Preventative and Major Rehabilitation Summary

According to the most recent inspections at the time of this update; the following pavement sections were identified as a Year-1 need for major rehabilitation:

- Runway 5-23 Sections 6315, 6310, and 6305
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Runway 9R-27L Sections 6210 and 6205
  - Reconstruction attributed to distresses related to loading, climate, and age of pavement.
- Hold Apron Taxiway A Section 5105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- T-Hangar Apron Section 4205
  - Mill and Overlay attributed to distresses related to loading, climate, and age of pavement.
- North Apron Section 4105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- North Apron Sections 4110 and 4132
  - Reconstruction attributed to distresses related to loading and construction quality.

- North Apron Sections 4127, 4125, 4120, and 4115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, PCC pavement growth, and age of pavement.
- Taxiway G Section 710
  - Reconstruction attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway G Section 705
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway F Section 610
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway C3 Sections 320 and 315
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway C2 Section 310
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway A3 Section 115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.

Appendix E summarizes the preventative repair recommendations for Year-1 and Appendix F provides an exhibit, Airfield Pavement Major Rehabilitation, that depicts the recommended major rehabilitation on the airfield pavement network according to work type and year.

#### 8.1 Airfield Pavement Network Definition Exhibit

The Airfield Pavement Network Definition Exhibit in Appendix A depicts the airfield layout in a manner that defines the airfield pavement infrastructure as branches, sections, and sample units in accordance with the ASTM D 5340-11. The exhibits are prepared and updated with information provided by the airport and from aerial imagery from the FDOT Surveying and Mapping publications.

#### 8.2 Airfield Pavement System Inventory Exhibit

The Airfield Pavement System Inventory Exhibit in Appendix A depicts any recent airfield pavement construction activity reported by the airport. The exhibit is intended to identify pavement sections that may have changed in geometry and pavement composition that would affect the section delineation. The information provided in the Airport Response Form was used as the basis of the changes and confirmed with the airport personnel at the time of inspection.

#### 8.3 Airfield Pavement Condition Index Rating Exhibit

The Airfield Pavement Condition Index Rating Exhibit in Appendix B has been prepared based on the section condition analysis of the distress data collected during the recent condition index rating survey. The exhibit graphically depicts the inventory with associated condition rating colors and PCI values.

#### 8.4 Airfield Pavement Major Rehabilitation Exhibit

The Airfield Pavement Major Rehabilitation Exhibit in Appendix F has been prepared based on the section pavement performance model and major rehabilitation analysis. The exhibit graphically depicts the inventory with associated rehabilitation activity, program year, and the planning level costs.

#### 8.5 Airfield Pavement Condition Survey Inspection Photographs

During the field condition survey inspection; inspectors photographed representative distress types observed. Select photographs are provided in Appendix G to provide visual support to special pavement conditions or distresses observed.

#### 9. RECOMMENDATIONS

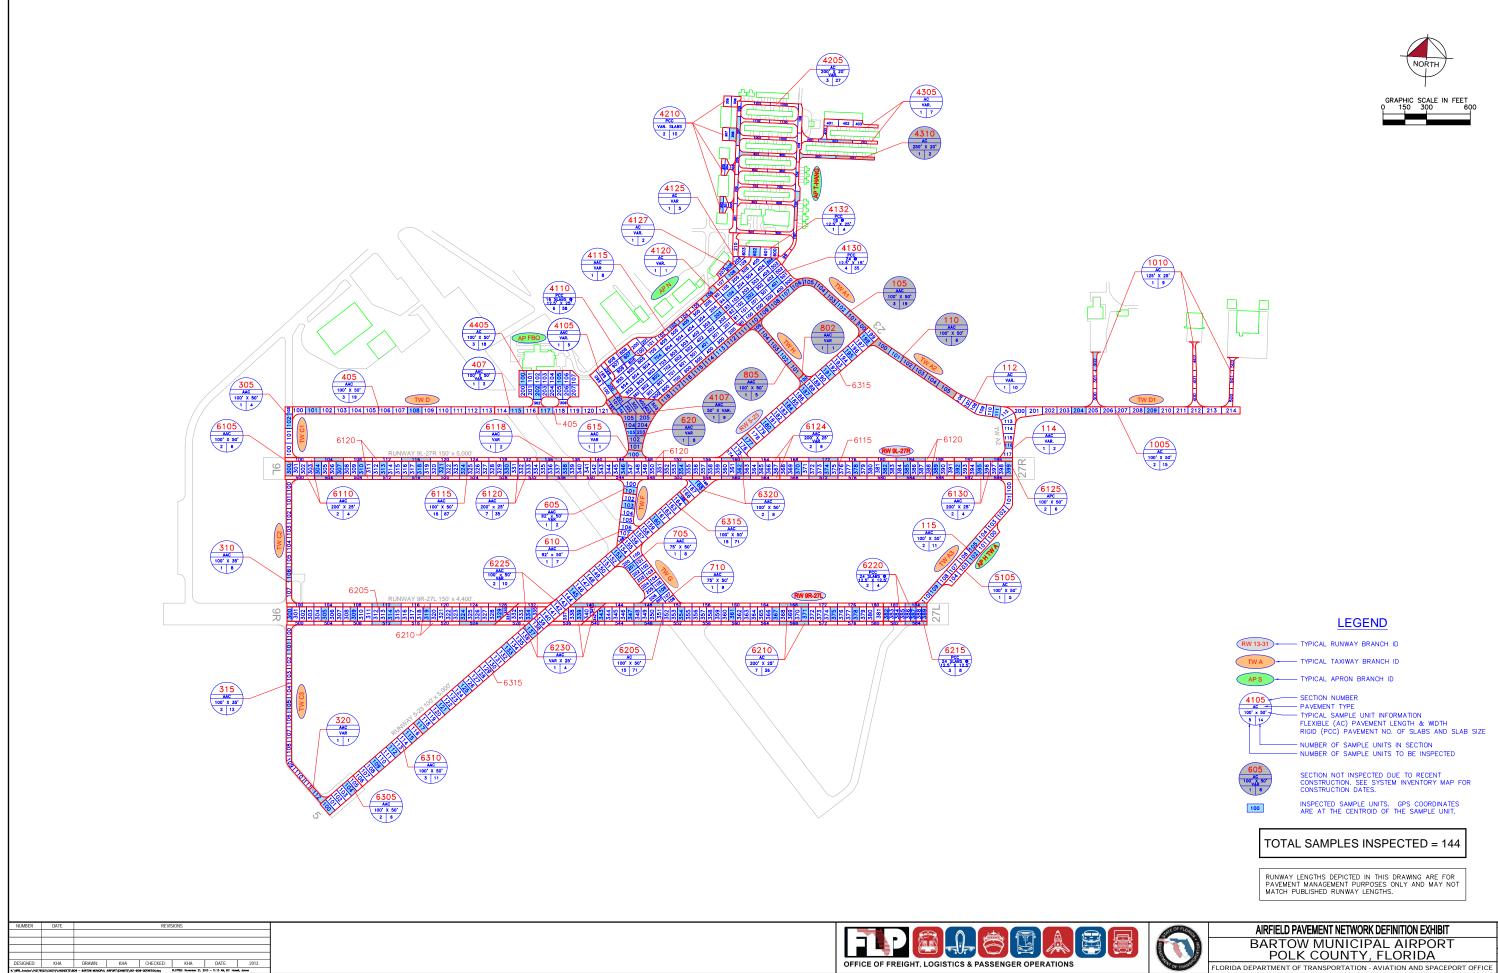

The following recommendations were made based on the 2013 condition survey inspection, condition analysis, and maintenance/rehabilitation analysis results:

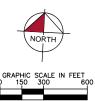

- Runway 5-23 Sections 6315, 6310, and 6305
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Runway 9R-27L Sections 6210 and 6205
  - Reconstruction attributed to distresses related to loading, climate, and age of pavement.
- Hold Apron Taxiway A Section 5105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- T-Hangar Apron Section 4205
  - Mill and Overlay attributed to distresses related to loading, climate, and age of pavement.
- North Apron Section 4105
  - Reconstruction attributed to distresses related to climate and age of pavement.
- North Apron Sections 4110 and 4132
  - Reconstruction attributed to distresses related to loading and construction quality.
- North Apron Sections 4127, 4125, 4120, and 4115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, PCC pavement growth, and age of pavement.
- Taxiway G Section 710
  - Reconstruction attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway G Section 705
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway F Section 610
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Taxiway C3 Sections 320 and 315
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.

- Taxiway C2 Section 310
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- Taxiway A3 Section 115
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- North Apron Section 4130
  - PCC Restoration attributed to distresses related to loading and construction quality.
- Taxiway F Section 615
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Runway 9R-27L Sections 6230 and 6225
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
- T-Hangar Apron Section 4305
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- T-Hangar Apron Section 4210
  - PCC Restoration attributed to distresses related to loading and construction quality.
- Runway 9L-27R Sections 6125 and 6118
  - Mill and Overlay attributed to distresses related to subgrade quality, climate, and age of pavement.
- Runway 9R-27L Sections 6215 and 6220
  - PCC Restoration attributed to distresses related to loading and construction quality.
- Taxiway D1 Section 1005
  - Mill and Overlay attributed to distresses related to climate and age of pavement.
